this volume contains the proceedings of the conference on formal and analytic solutions of diff equations held from june 28 july 2 2021 and hosted by university of Alcalá Alcalá de Henares Spain the manuscripts cover recent advances in the study of formal and analytic solutions of different kinds of equations such as ordinary differential equations difference equations q difference equations partial differential equations moment differential equations etc also discussed are related topics such as summability of formal solutions and the asymptotic study of their solutions the volume is intended not only for researchers in this field of knowledge but also for students who aim to acquire new techniques and learn recent results

in the last forty years nonlinear analysis has been broadly and rapidly developed lectures presented in the international conference on variational methods at the chern institute of mathematics in tianjin of may 2009 reflect this development from different angles this volume contains articles based on lectures in the following areas of nonlinear analysis critical point theory hamiltonian dynamics partial differential equations and systems kam theory bifurcation theory symplectic geometry geometrical analysis and celestial

mechanics combinations of topological analytical especially variational geometrical and algebraic methods in these researches play important roles in this proceedings introductory materials on new theories and surveys on traditional topics are also given further perspectives and open problems on hopeful research topics in related areas are described and proposed researchers graduate and postgraduate students from a wide range of areas in mathematics and physics will find contents in this proceedings are helpful

this book aims to capture the interest of researchers and professionals in information technology computer science and mathematics it covers fundamental and advanced concepts related to intelligent computing paradigms data sciences graph theory and mathematical modeling in high performance computing the need for intelligent adaptive computing mechanisms and the integration of mathematical modeling in computational algorithms is becoming increasingly significant serving as a valuable resource for industry professionals this book also supports beginners in gaining insights into enhanced computing paradigms and mathematical concepts from foundational to advanced levels our objective is to provide a platform for researchers engineers academicians and industry experts worldwide to share their findings on emerging trends the authors believe this book not only presents innovative ideas but also fosters engaging discussions and inspires new perspectives

this introduction to the singularly perturbed methods in the nonlinear elliptic partial differential equations emphasises the existence and local uniqueness of solutions exhibiting concentration property the authors avoid using sophisticated estimates and explain the main techniques by thoroughly investigating two relatively simple but typical non compact elliptic problems each chapter then progresses to other related problems to help the reader learn more about the general theories developed from singularly perturbed methods designed for phd students and junior mathematicians intending to do their research in the area of elliptic differential equations the text covers three main topics the first is the compactness of the minimization sequences or the palais-smale sequences or a sequence of approximate solutions the second is the construction of peak or bubbling solutions by using the lyapunov-schmidt reduction method and the third is the local uniqueness of these solutions

this book contains papers presented at the workshop on singularities in pde and the calculus of variations at the crm in july 2006 the main theme of the meeting was the

formation of geometrical singularities in pde problems with a variational formulation these equations typically arise in some applications to physics engineering or biology for example and their resolution often requires a combination of methods coming from areas such as functional and harmonic analysis differential geometry and geometric measure theory among the pde problems discussed were the cahn hilliard model of phase transitions and domain walls vortices in ginzburg landau type models for superconductivity and superfluidity the ohno kawasaki model for diblock copolymers models of image enhancement and monge ampere functions the articles give a sampling of problems and methods in this diverse area of mathematics which touches a large part of modern mathematics and its applications

geometric analysis combines differential equations with differential geometry an important aspect of geometric analysis is to approach geometric problems by studying differential equations besides some known linear differential operators such as the laplace operator many differential equations arising from differential geometry are nonlinear a particularly important example is the monge ampère equation applications to geometric problems have also motivated new methods and techniques in differential equations the field of geometric analysis is broad and has had many striking applications this handbook of geometric analysis the first of the two to be published in the alm series presents introductions and survey papers treating important topics in geometric analysis with their applications to related fields it can be used as a reference by graduate students and by researchers in related areas back cover
